

Customizing Search Values

Customizing search values in your brand requires adding custom JavaScript. To do this:

1. Click on "Add CSS/Javascript" in the Brand Designer, specify the file name, select the "JavaScript" radio button, and click "Apply" to create a new file.
2. Reopen the Brand Designer and your new file will appear at the bottom of left panel.
3. Click on that file, and add your custom JavaScript.

To change the placeholder text in Confluence's Quick Search field:

Add the following to your script file, and then click "Apply" to save the JavaScript in your brand and see the results:

Example custom-javascript.js

```
// Change the placeholder text in Confluence's quick search field
AJS.toInit( function ($) {
  $("#quick-search-query").attr("placeholder", "Search Me");
});
```

To change the button text on the Live Search macro:

Add the following to your script file, and then click "Apply" to save the JavaScript in your brand and see the results:

Example custom-javascript.js

```
// Change the button text on the live search macro
AJS.toInit( function ($) {
  $(".plugin_livesearch_buttonbox input").val("Search Me");
});
```
